

TOC

We have 3 approaches for Table of Contents (ToC)

- [Maketoc](#)
 - It is not a real plugin like the others (there is no help)
 - There are issues which are hard to fix in current implementation, such as [maketoc_encoding](#)
 - If we keep the syntax, it likely should be moved to a JavaScript
- [pluginTOC](#) for [Structure](#)
- [Auto TOC](#)

Let's rationalize this for Tiki13 / Tiki14 in a modern and future-proof way, along with [Menu Revamp](#) and possibly some work on the [Structure](#) feature.
