

## TRIM

The "Tiki Remote Instance Manager (TRIM)" has gone into maintenance mode, and the code was forked and revamped to become its replacement, now known as the "[Tiki Manager](#)".

TRIM is an acronym for the **Tiki Remote Instance Manager**

See also [TIM](#) and Tiki [Console](#).

Some of the wishes below will likely be handled by [Monitoring](#) and [Configuration Management and Systems Orchestration](#)

State as of October 2018

- 2017-2018 was a very active period for TRIM :  
<https://sourceforge.net/p/tikiwiki/code/HEAD/log/?path=/trim> Mostly:
  - Addition and refinement of clone and clone-and-upgrade
  - Permit support on setups with multiple versions of PHP. Ex.:  
<http://wikisuite.org/How-to-install-a-PHP-version-picker-on-ClearOS> (which itself had some trickiness with respect to Command Line version of PHP vs web version of PHP)
    - This uncovered a lot of edge cases, as TRIM is regularly moving between directories.
    - This was necessary to start using in production for [Pre-Dogfood Servers](#)
    - A test [Test plan was created](#)

State as of April 2017

- After a pretty calm period in 2012-2013-2014, there has been a recent increase in activity in 2015-2016-2017: <https://sourceforge.net/p/tikiwiki/code/HEAD/log/?path=/trim>
- Has quite a few features but mostly used for backups
- Use at your own risk. However, it was demonstrated to work on different hosts, so somewhat usable.
- It is somewhat usable in "ideal" conditions (ideal PHP configuration, certain tools must be installed on the server), but not yet robust to deal with various server configurations.
- It is not yet fully documented. It is a wizard-like app, so if you are familiar with shell scripts and installing/upgrading Tiki, you *should* be OK. However, it is not robust to user errors. For example, if you mistype your database username, the script could just die instead of giving a second chance.
- A revamp is being contemplated: [TRIM Revamp](#)

^

Who is behind this?

- Marc Laporte
- Jonny Bradley
- Louis-Martin Richard (tester)
- Philippe Back (plans to add a nicer front-end GUI)
- amette
- Rodrigo Primo (added WordPress support)
- You? (We are looking for Beta-testers!!)

Nice to have

- If TRIM tries to make an instance where there is a directory "images", it will causes conflicts and create problems.
  - TRIM could check that no conflicting directories exist

Feedback on fresh install of TRIM as of 2016-04-04

- ~~"make instance": should offer to create a username and db from root access done a long time ago~~
- TRIM should warn if not on PHP 5.5 CLI (for Tiki 13.x+)

Feedback on fresh install of TRIM as of 2016-02-12

Improvements

- ~~make access should cd to the right directory done~~
- ~~default web root should be /var/www/virtual/example.org instead of /home/root/public\_html done, depending on OS~~
- ~~backup format should go from 1\_2016-02-12\_04-19-40.tar.bz2 to 1\_example.org\_2016-02-12\_04-19-40.tar.bz2 done~~
- If TRIM fails (ex: to login, to backup, etc.), an email alert should be sent out.

## Web

The command line TRIM is useful, but the web GUI never got the attention it deserves. It needs a revamp to

1. Bootstrap UI in standalone version
  - Perhaps make use of Adminer or Adminer Editor: <https://www.adminer.org/>
2. be re-architected to run in a Tiki
  - Use Tiki groups and permissions
  - Site list to be connected to trackers to track meta-data
3. as a ClearOS app to manage 1 or many Tiki instances
