Description
I configured the mail-in service for the wiki,I tried with wiki-append, wiki,... configuration but the mail-in doesn't work as aspected. The page, if needed, is created but the body is not updated

I tried with outlook 2003 from the local intranet and also from the web interface of GMail.

thanks
Christian

Solution
Please check again.
Mail-in, at least for wiki pages, has been revamped in Tiki 12

I found the same problems. Part of the problem could be with Message-ID vs Message-Id (see other bug).

But I also found that the code is looking for $output'text' when it should be looking for $output'body'. I made some local fixes, but am just mimicing PHP from what's in the file, so I don't trust my fixes.

drlazer 05 Mar 07 02:01 GMT-0000

I also see a confusion between article "heading" and "body" fields in the code. What is "heading" for, anyway? IMHO, the tiki-mailin-code.php should add the entire body of the email to the body of the article, but instead it's trimming and placing the trimmed stuff in "heading".

If you leave the "Discard to the end from" field blank (in the mailin administration), you will have the entire message discarded. The default of '\n' would be a partial fix.

biggosh 11 Mar 07 00:47 GMT-0000

I agree with u, the code is not clean and propably is not stable.
There is a least one var_dump() in the same file that has to be removed in order not to display the dump to end users.

Coming back to "partial solution" for wiki-append:

1. I implemented the modification u suggest to get_mail_body function but I added this code

if $output%22body%22
$body=output%22body%22;
elseif ....

This in order to try to minimize the impact of the "fix"

2. I commented out the piece of code regarding the "discard to the end from".

I probably fix the page for wiki part. I will post it if I reach this goal.
