Description

I've accepted a friendship request, using 1.9cvs code from a couple of days, and I saw those two lines at the top of the page,

Notice: Undefined variable: local_sender_email in /home/httpd/tiki19/lib/messu/messulib.php on line 90

Notice: Undefined variable: local_sender_email in /home/httpd/tiki19/lib/messu/messulib.php on line 91

plus the normal output below:

Accepted friendship request from userXXX

tiki-friends.php?accept=userXXX

BTW, "friendship network" is missing from categories Feature in this website dev.tw.o! (so that, nowadays, it cannot be selected at bug report time)

Solution

wrong variable name, maybe leftover from previous renaming

I'm getting the same error when just sending mails (i guess if 'email is public'='y?')

Seems to be setting and then testing the length of "\$sender_mail" but trying to read \$local_sender_email, which doesn't seem to exist (anywhere else in that file).

I have changed mine - patch attached for practice...
