Bugs & Wish list

When the system (in this case was a Linux box) runs out of disk space, a Tiki user cannot login. Basically, the user is sent back to the home page. In other words, it looks like the user has authenticated, but is not logged in. So it looks like a PHP session issue. It could well be.

If the user enters a wrong password, a wrong password message is seen.

It would be nice if Tiki could detect that the disk space is low and alert admin users, especially during install. Low priority of course, but still nice to have.

MoinMoin example:

No image specified. One of the following parameters must be set: fileld, randomGalleryId, fgalld, attld, id, or src.
Importance
1 low
Priority
5
