Description

PluginCode doesn't show colors for php code, as it should according to doc page:

<http://doc.tikiwiki.org/PluginCode>

Tried with param colors=>php or colors=>phpcode:

```
{CODE(colors=>php)} /** Return system defined temporary directory. * In Unix, this is usually /tmp * In Windows, this is usually c:\windows\temp or c:\winnt\temp * \static */ function tempdir() { static $tempdir; <b>$tempdir = '../tmp';</b> <b>*/</b> if (!$tempdir) { $tempfile = tempnam(false, ""); $tempdir = dirname($tempfile); @unlink($tempfile); } <b>*/</b> return $tempdir; } } {CODE}
```

And it returned:

```
/** Return system defined temporary directory. * In Unix, this is usually /tmp * In Windows, this
is usually c:\windows\temp or c:\winnt\temp */ static */ function tempdir() { static $tempdir;
$tempdir = './tmp'; /* if (!$tempdir) { $tempfile = tempnam(false,""); $tempdir =
dirname($tempfile); @unlink($tempfile); } */ return $tempdir; } }
```

Update: RFE for plugincode:

Why not using "wrap=>1" as default param instead as "wrap=>0"?

Solution

From the doc:

Since GeSHI has been licensed under GPL only - which is incompatible with Tikiwiki's LGPL licence - you need to manually download (<http://qbnz.com/highlighter>) and copy GeSHI in your own tikiwiki's lib/geshi/ directory. You can also install the stable version of GeSHI with the Debian/Ubuntu package "php-geshi".

This would be a great Mods

CodeMirror is bundled in Tiki and doesn't require an additional installation.
