Description
 1.9.0DR4 worked fine. 1.9.0 fails.
 If you have a multitiki and create custom css/tpl files, they are not traversed. For example, If you
 have a multiwiki on www.foo.com and create a style called 'bar', the correct place to put the
 customized css files is
 /styles/www.foo.com/bar.css
 But this no longer works. It has to be in /styles/bar.css

 The tpl files should be in
 /templates/www.foo.com/styles/bar/
 But this no longer works. It has to be in /templates/styles/bar

 Please put back the old way. The current (broken) way prevents me from having styles of the same
 name on different multiwikis. each with customization.

Solution
 There is a negative report on that - to be specific: this site! It runs cleanly with those exact settings!
 Please confirm and close!

I don't see how I can evaluate or test this in an area I have very little knowledge...
@Gary Cunningham-Lee do you know if this is still relevant ?

Gary Cunningham-Lee 23 Sep 21 13:44 GMT-0000

I have no idea. I have a MultiTiki but I just use different themes for the sites. Since the bug report is
from Tiki 1.9, I suppose a workaround has been found. I don't think just renaming the files would be a
problem. I suggest the bug report be closed because it's so old and there's an easy alternative
method.
