Description
Use case:

- Manage many sites/domains with one Tiki installation
- "Park" all the domains on top of each other and get Tiki to send people to the right page depending on the domain.
- Common user base & permissions
- Theme control to provide different theme per section/category/page
- Could be different domain per language

Ideas

- Maybe domains could be links to categories. Put a page in a category and it gets its theme from theme control center
- Modules per domain
- If on page for domain X, force/rewrite URL to that domain

For example

www.musicband1.com/introband1
www.musicband2.com/introband2

www.musicband3.com/introband3

So if I go to:
www.musicband1.com/introband2
I am redirected to

www.musicband1.com/introband1

Limitation:

- pagename collision. Ex: domain1.com/intro = domain2.com/intro
- Single shared search engine
- Meta-tags will be shared

Also need to think about the Use Case where different workgroups want different domains. (A bit like *tikiwiki.org sites)

With new Tiki4 Workspaces, we could associate the domain as a preference.

What happens if a wiki page is in many categories, and they have different domain names. How would the priority work? Random? An order? Same idea as default group?

I've implemented this before in another CMS for multiple online news services, including login access for subscribers via a separate newsletter management system. I'd like to assist with this capability as I have recently started using Tiki and feel it may be worth migrating in the future.

Marc Laporte 04 Aug 09 14:25 GMT-0000

Now that (in 4.0) general preferences will be overrideable per workspace, not only domain name, but Site title, site subtitle, etc. will be settable per workspace/domain.
