Description
 This started when I discovered that when trying to register with an address using the "GMail-Format" like
 normal.mail+something@gmail.com and it will fail although the address is valid. I have made a quick fix to allow '+' in the name part of the email address, but obviously more can be done to make this more RFC compliant. Will have to double check that email actually sends, of course.

I tried registering again in 4.x and it seems I can't again with the gmail type address. Maybe the problem still exist?
