Description
This would be nice to have more control over menu look & feel

http://wiki.novemberborn.net/sifr/
"sIFR (or Scalable Inman Flash Replacement) is a technology that allows you to replace text elements on screen with Flash equivalents."

http://www.text2png.com/code_standalone.php

http://www.iconforge.co.za/

Solution
Any font may be used now with embedded fonts in the CSS file. Many tiki themes are already doing this. Serves like https://www.fontsquirrel.com/ can prepare fonts for use in each browser with great
compatibility.

Go to [http://www.google.com/webfonts](http://www.google.com/webfonts). Choose one or more fonts.
Get the code. One bit is a link to fonts.googleapis.com for the font(s). This can either go in the HTML head section or be called by an @import statement in a Tiki stylesheet. The second bit is the font-family name to be added in the appropriate places in the Tiki stylesheet (as the font-family property of h1 or .box-title or whatever).

There is no admin selector but each theme can set the font.

You can use the following to detect font:
