Description
    I've installed a new Tikiwiki at http://www.vic-fontaine.com/forum and started configuring it.

    Now I have the following: No-one can log in any longer.

    Steps to reproduce (at my installation):

- Create new user
- Confirm e-mail
- Log out new user

    > Login not possible

    Admin can't log in either. I've managed to reset admin password to "admin". Still can't log in.

    I've posted a questin in the forum, but now I believe this really is a bug. If you need more
    information about my installation, I can give it to you (database entries etc.)
    Please feel free to log into my installation as admin if you manage to.

Solution
    This appears to be the challenge/response feature.

    update tiki_preferences set value = 'n' where name='feature_challenge'; might workaround.

Looking at the feature itself more closely.

I can't login, so I can't check for sure. But I changed some security options. Is it possible lo look up options in db tables?

morrighu 20 Apr 08 19:10 GMT-0000

I had something similar happen. I went into the users_users table and set "valid" to NULL. Then I turned off the admin and email validation. Log in is now working again.

See if that doesn't do it for you as well. Once you get your users logging in again, then you can turn the validation back on. Use their user name to send them a "reset password" from the log in screen.

I'm deleting the attachment as it contains my email address. This has been solved for years anyway...
