Description

After running `./fixperms.sh fix` on the server side (Debian based, having root perms on server), and using 1.10svn code from mid May 2008, admins of the tiki site can still install mods on the server through the Tiki admini mods interface.

It used to work before (months ago, when I last used that).

our server, afaik, has `www-data` and `www-data` as user and group.

We are using a multitiki installation, with tikis under subdirectories.

I'm afraid that admins of the other tikis from the same multitiki are able to remove mods that we are using and need, etc.

...

Solution

not valid any more. `fixperms.sh` is not used any more but `setup.sh`
