Description

If you create a tracker with rating and you show the rating in the tracker list you have at least two problems:

- first you don't have just the rating but the complete voting grid in the list which is not what I expected but hey might be ok or at least should be noted somewhere but this is not the pb
- if a user votes click on the rating array two things happend :
 - the global rating is changed which is not cool
 - more importantly some other fields get changed to the value of the rating ! even fields with drop down menu !!

So first the bug that changing the rating changes also other fields.

Second tracker fields with values from a list are not checked to verify that the value supplied is in the value list 😞

Can you please retest with current supported versions (e.g., Tiki12, ...)?
