Description

Cutting and pasting text often involves text which has paragraphs which begin with indented lines. These could be recognized by the editors and converted into paragraphs.

If text area feature "paragraph deindent" is turned on, a line which begins with two or more spaces should be converted into the start of a paragraph. In the normal editor, this text would be moved to the start of the line and a single blank line would appear as a paragraph separator. Note that multiple blank lines before the paragraph should be compressed to a single blank line. Text with indented paragraphs often does not have a blank line between paragraphs, so the code needs to ensure that a paragraph marker exists.
