Description
It is possible to enter tags made from more than one word by entering them between "". Since 3.0, the system seems to still recognize those tags (they are rendered correctly in the "Most popular tags" module, but clicking on such a tag comes up with "0 results found". The same applies for the Folksonomy module, which shows correctly, but comes up with 0 results for such tags. It does not matter if the tagged object is a blog post or a wiki entry.

Solution
The system should recognize tags from more than one word correctly in such a manner, that clicking on them to select tagged content results in correctly selected objects.
