Description

The Page translation module uses the pageLang global variable to determine the language of the page being viewed. tiki-index.php does not set that variable anymore since r14757. This breaks filter_languages_from_pivot when viewing pages in the reference language and using a Reference language parameter. Then, translations of the currently viewed page are not displayed. pageLang was moved to renderlib, in setupMultilingual(), but setupMultilingual() can be called several times in a request on tiki-all_languages.php, so this needs a deeper fix than declaring pageLang as global.
