Description

After upgrading from 4.0 to 4.2 using a overwrite and save db/local.php I have gotten this error:

The following error message appears now:

-----

Unknown column 'event' in 'field list'

The query was:

```
select `event` from `tiki_secdb`
```

The built query was likely:

```
select `event` from `tiki_secdb`
```

-----

The install and db upgrade complete successfull. Have run the upgrade again and this still happens. Also I get page errors.

Short version is that the tikiwiki has become unstable. I can not access wiki pages by using the name but edit can find them but save fails also.
