Description

     The "pagename" parameter of {toc} seems to be ignored.

     On any new wiki page {toc} would not be expected to show anything since the page is not part of a structure. This works as expected.

     However change that to {toc maxdepth=3 shownum=1 structId=15} (or any other valid structure Id) and the first three levels of the structure are correctly listed.

     From that structure listing, pick a target page, preferably one which is known to have sub-ordinate pages in the structure, for example
{toc maxdepth=3 shownum="1" structId=15 pagename=Group#03} or {toc maxdepth=3 shownum="1" structId=15 pagename=Smith_Fred_1234}

     This should list the structure below page "Group#03" or "Smith_Fred_1234", but instead it lists the root of the structure, as if the "pagename" was missing.

     Also, for a page in a structure, the pagename does not default to the current page (as per documentation at http://doc.tikiwiki.org/Structure+User) when structId is used

     Further background at
http://tikiwiki.org/tiki-view_forum_thread.php?comments_parentId=37636&topics_sort_mode=lastPost_desc&forumId=4 This is really hurting us.

     We're new to TikiWiki and any work-around suggestions would be really helpful.

     Thanks

     Martin

     U1. Updated with alternate example page names

hi,
i guess it doesn't work for you because #something is usually indicating "go and scroll to html anchor tag on the page", so it thinks actually that the page name is "Group" with anchor tag id="03" and not "Group#03"

workaround would be rename the page name to "Group03" or use "Group%2303" where "%23" is valid character "#", but URL encoded

luci

hmm, so I picked a bad page name for my example. I can confirm it is also broken with page names such as Smith_Ref_1234
