Description
    Hello,

    I have reached the end of an installation of 5.0 with à database upgrade by 4.2 installer form a 3.3
    site.

    To reach this point after one month, I need to find and make the patches of bugs form which 3 on 5
    are corrected into the current 5.x (SVN repository)

    After I could obtain the home page, this appends :

    1 - the "main admin" sends the message :

    INVALID DATABASE run installer,

    2- You run installer again, the installer says "Database upgraded successfully"

    3- You run normally tikiwiki and then come back to point 1, eternally

    If I join documents they can be the HTML page capture from Zotero but I don't think that they will
    be useful or the .zip of the database (600ko) for test.

    I have surely no information to try to understand this issue.

    When I try to execute some command I have quite not any command which can be run without an
    error :
    - All displays are like UTF8 on a latin1 display (while Firefox say Page encode UTF8)

- Try to edit user pref : -> system error table ".tiki_trk_1" not found
- Try to display Wiki page or article content : the url called misses any module (*.php) tu run and no query "?" but only a part of the query content (like "http://mysite/<article_name>.

- Modify-edit page or article leads to an empty page

etc.
