Description
    Tiki: 6.1
    Browsers:

        • Firefox - 3.6.13
        • Safari - 5.0.3

    When I use the {IMG} plugin to load a PNG file that has a transparent background from a file
    gallery it becomes a JPG (specifically a "jpeg") and all transparency is lost. The image has a black
    background. If I load the same file from the filesystem directly using the same {IMG} plugin it loads
    properly.

    I have created an example page with viewable source here

    I am uncertain as to if this is a clue for this bug report, or if it should be a separate bug report,
    however displaying the same PNG from the file gallery produces a very low quality jpg
    representation as well. A screenshot of the image displayed through the file gallery can be access
    from here.
