Description
Using Tiki 6.x (proposals) and Tiki 7 (trunk)

I have a wiki page that belongs to multiple structures.

I have the "open page as structure" option enabled.

If I open the page directly, Tiki does not know which structure to use, so it opens the page with no
structure.

This means that the generated TOC is empty. The only way the end-user knows that the page is
supposed to be in a structure is by selecting a specific item from the Structure drop list.

But the end-user may not have any understanding of what a "wiki structure" actually is.

There should be a way to set the default structure for a page.

Solution
Possible fixes:

- When pages belong to multiple structures, allow me to specify a default structure for the page

or

- Better notification to end-user

better notification of user could be:
present a Choice of the structure to go to out of all the user has permission to read.
