Description

When the PluginButton plugin is included in a User Module and that User Module is used on the wiki, it will lock down the wiki in "Internal Error 500" mode. So no matter what page you visit, you will get "500 internal error".

Tested on:

TikiWiki v. 6.1 on IIS 7.5

Solution

The solution to getting the Wiki out of the looping error, is to delete the module's entries in: tiki_modules and tiki_user_modules. (you can use the module name of your user module to identify).
