

website user/visitor.

The WYSIWYG/CKE editor works normal and I can see the content just normal like ever, being in the editing mode. But when I save, I can just see the source code, like it would be in codeplugin.

This affects as said articles and calendar (perhabs more, I will hope to find out) but it does not affect wikipages by now.

And it affects existing articles and events aswell as newly edited.

(worked well in 6.x before)

Thx for reply and wish a nice sunday to all,  
cheers  
Torsten

## Comments

**SteveH** 21 Aug 11 21:55 GMT-0000

I've experienced the same issue with Tiki v7.0. Namely, when writing or pasting articles in the "Body" section, all of the HTML code is displayed when it's previewed, saved or published.

It appears the "Body" section on the edit page for articles is useless in this regards.

However, until this is fixed, it's possible to partially get around this annoying issue by entering all of the text in the "Heading" section, which seems only able to use the Wiki editor and not WYSIWYG.

In order to make images and email links easier to access and insert into the article, you

can make limited modifications to the WIKI options menu by inserting these on the Admin Toolbar feature page (tiki-admin\_toolbars.php).

This isn't intended to be a "fix" - just a "workaround" until competent developers find the time to fix this, meanwhile ignore the Body section.

=====

"Where technology is concerned, Creative Thinkers realize there is always at least two ways to do something. Of course, if there are ONLY two ways, then it's often either the right way or the wrong way. Which one it turns out to be can only be determined by T&E."

Just to add that I am experiencing the same bug, on Wiki pages as well as in articles.

**Philippe Cloutier** 05 Jan 18 21:24 GMT-0000

Ticket #4031 and this one are probably about the same bug. Can you reproduce in a current version?
