Description
Hi,

This problems concerns quite all table and forms (in tables or

not) with fixedwidth themes.

This is the reason while it appear in so many functions.

As for most of tables in many functions, with "twist" (no other style tested) the tables of the middle (C2) either overlap C3 or are behind C3 and sometimes C2. They just have a little part outside the 990px large (in twist as the width is written into css it can't be changed by prefs).

The corresponding functions are then completely unusable.

—

Here I write this for the example elementary function "add an element to a structure" givin in screenshots joined documents

Three scrennshots proposed are :

1. What a user see
2. The limit of the div as shown by firebug
3. The whole div zone hidden

Solution
A complete review of all functions which display tables into the middle.
Associate style class so that they will be displayed above C2 and C3 with a defined solid background.

This makes tables often overlap C3 but it is not so bad and restore basic functions.
If this solution would be permanent, a button to get upon the ol3 (C3) should be useful (I have not tested, neither detailed how to do it)

The new style with new classes and linked TPL will be on a branch in experimental/trebly/... with comments.

There are so many changes into the style (minor in tpl adding only classes for many div tags or id) that the style is named now twist-T1 (to be able to compare easily).
The url given to developer to test is combine with "user allowed to change theme".
The changes of other php and tpl just defines the use of new class or id css elements, so they don't change the behavior of other themes.

I suppose that all style using fixedwidth have to be tested too.
