Description

Categories are rather useful things. However, in a site with hundreds of objects, being able to add items to a category at maximum 50 a time makes life unnecessarily hard.

The use case in question: a site which needs review. I need to add all the wiki pages and articles to a "Requires Review" category following an update of a very old site with lots of content. I cannot, because this limit of 50 stops me from adding the lot in one go, and the lack of any discernible way to select objects which are *not* yet in the category for addition stops me from adding 50 at a time. I seem to be at an impasse, short of writing my own PHP code to add objects en-masse.

Something more like the page wiki index doesn't seem like it would be a very hard thing to add? However, I am not familiar with Tiki's internals so this is hard to estimate.
