### Description

Please see:

<http://doc.tiki.org/Changelog+1.8>

<http://doc.tiki.org/Changelog+1.9>

Update: still present in 18.x 🙄

### Solution

There is one unclosed wikiplugin syntax in svn commit message `list({JABBER()})`.

Also there is another issue related to default height in CodeMirror. I had fixed the height issue. Please check this commit id: 48139.

Good catch Mani, but this used to work before (Is it worth regression commit?). Also, this is not unusual to put an unclosed plugin in PluginCode...

### Workaround

Nice catch spotting the unclosed jabber plugin in the body of the code plugin - i fixed it on that page by adding no parse tags round it. I would suggest not fixing this as it would almost certainly lead to other, worse, regressions IMHO

### Importance

10 high

### Easy to solve?

Hi Marc,

The magic happens `lib/core/WikiParser/PluginMatcher.php`. The underlying problem is that if there is a plugin open that is not closed, the enveloping plugin will not be detected as a plugin. Could be a feature rather than a bug since unclosed plugins are a common problem in parsing. However, I admit the CODE plugin could be an exception (but I dislike polluting the code with these kind of hardcoded exceptions unless there is a rule to determine plugins like this). Needs to be escalated to Jonny and I think he will suggest talking to LP as well. How about asking LP about this when he is back?
