Description

Permission from category are not applied for `tiki_p_edit` (Can edit/create pages) even if group "Default category assigned to uncategorized object edited by a user with this default group" is set. Unless GLOBAL permission for `tiki_p_edit` is set (which is wrong as user of this group will be now able to create and edit any page anywhere without being locked in their category:structure).

Real life case:

I have a tiki with several section (shop, store, marketing).

I create a category for each section.

For each section i also create group of user so each each group can edit is own section only.

I set 3 structures so user can also create page in his structure/category/section.

In group preference, i set each group to have "Default category assigned to uncategorized object edited by a user with this default group" with the relevant category (group_shop to category_shop, etc).

As things should work.

If a member of group_shop create a (child) page from a page in structure_shop having `tiki_p_edit` checked for category_shop, tiki should understand that the new page should inherit from the same category permission (category_shop) and create/edit the page.

But this is not happening. Tiki see the new page to be create has "non-categorised" yet therefor

doesn't allow the creation for a usergroup with tiki_p_edit unchecked in global permissions.

Summary: When creating a new page, tiki should check user group category permission and apply them prior the page exist (applying inheritance on a create state page - not saved yet).

Workaround

With the nice demonstration i have done i deserve this being solved !!! 😊
