This is because each morning something is happening with the index. We did change to ElasticSearch and therefore maybe the upgrade scripts need to account for this

Nelson Ko 28 Nov 13 01:03 GMT-0000

P thinks the problem is that the following pref needs to be cleared after the db is cloned over, otherwise it will destroy the index what that one rebuilds.

`unified_elastic_index_current`

Have emailed changi to ask if is it possible to after the db is copied over to nextdev.tiki.org, to 'delete from tiki_preferences where name="unified_elastic_index_current";' ?
