Description

Already reported in No drag and drop for large structures?

For some structures existing pages can be added per drag and drop. However new items cannot be selected with drag and drop for some other structures in the same wiki. I spent many hours to find a difference between the two structure types. Up to now, the main difference is the size. Large structures, which do not fit into the browser screen, do not work. For medium size structures, I found a work around: Drag and drop is possible, when the browser's zoom factor is set to value that shows the whole wiki page in the browser window.

Pages can be moved within a structure, but it is not possible to add existing pages.

Reproduced in Test wiki with small structure and big zoom factor.

Not only as a workaround but a very helpfull feature: the edit_structure tool should be able to collapse subtrees
