

timezone.

The skew is also compounding; if 'preview' is used multiple times, the Publish Date can end up being quite distant from the actual date and time of the blog post.

I have related tickets 1579 and 4007 as they describe similar behaviour in the Banners feature; please feel free to un-relate if they are not pertinent.

Edit 2015-10-22: After demonstrating on show.t.o, it appears the skew may relate to the timezone of the underlying server, rather than what is being inferred by Tiki from the user. However, it is still the case that setting an explicit timezone alleviates the issue.

Workaround

This can be worked around by:

- setting a timezone other than UTC for the site or user, or
- correcting the Publish Date before saving the post.

Be advised that this is the first ticket I've posted, so if I've committed any *faux pas* please let me know for future reference 😊. Also, please advise if there is a particular point at which I should destroy the show.t.o instance.
