Description
    make backup 9 puts the data in trim/backup/10

    Because instance IDs start with 0. Maybe just change IDs in the GUI so as to not affect backup
    locations?

Actually it is a little bit more complicated.

The number mismatch is happening because the backup folders use the instance ID but the instance selection displayed to users use a simple sequential list. When a instance is removed the ID of the subsequent instances are preserved but their number displayed to users in the instance selection list changes. In your example, it is likely that an instance with ID <= 9.

This is not only confusing, it also introduces at least one bug. The script setupupdate.php uses the temporary number of an instance from the selection list instead of the instance ID. If an instance is removed this will cause previously configured update cron jobs to start updating different instances.

I'm checking if it is possible to solve this by displaying to the users the instance ID in the selection list.

In the commit below I have changed the user interface to use the instances IDs and thus avoid problems like the one mentioned in the description of this ticket and the one in the comment above. This is a significant change. I did my best to test it but I might have missed something. It would be great if others could test it as well. Cronjobs configured to update a specific Tiki instance using TRIM must be updated.
