Description
    If you check the setting "Wysiwyg Mode" in the Wizard so that you have the Wysiwyg Editor and edit a page it appears that there is a bug regarding brackets.

    What I did was, I edited the standard homepage from tiki wiki and wrote a h1 heading with "Hier steht jetzt irgendwas" and beneath it i added a %22Test%22.

    When I safe the page and reload it, the browser shows everything correct, accept that there is a unencoded sign (the ? on a black diamong) behind "jetzt".

    If I try to edit the page again, the input field is empty, accept for "ajax error" and I get the error message:

    Fehler
    json_encode - Malformed UTF-8 characters, possibly incorrectly encoded

    Will try to reproduce my issue on a tiki instance here.

Hi - sorry, cannot reproduce and show seems to be broken still - i added "square bracket [] some thing" to a wiki wysiwyg page and it seemed fine...
