Description

There are several times that a HTML wiki page will fail to render a paragraph.

- In a footnote, the paragraph will fail to render when there is one paragraph, however all paragraphs will render correctly (more or less) if there is two or more paragraphs.
- A paragraph within a opening and closing HTML pair will fail to render in a similar way.

There is a tiki instance that clearly demonstrates this.

Solution

fixed in tiki 17, with the footnote rewrite.

Workaround

Adding a line return immediately after the opening html tag, will cause the first paragraph to render. This does not work within a footnote.
