Description

Selecting a new wiki homepage "Courses:_:Foo" got understood as "Courses" as the new wiki homepage.

I'm using :: as the default namespace separator for workspaces.

This was working as expected in Tiki12.

Reproduced here:

<http://xavi-9794-6103.show.tikiwiki.org/tiki-admin.php?page=wiki>

u: admin

p: 12345

page selected as homepage was:

Course_Template:_:2016 Fall:_:Course Outline

but it was stored as:

Course_Template

In addition, there are some other oddities with workspaces in 15.x, but that is another story (to be reported aside elsewhere)

Solution

fix confirmed, thanks!

Hello Xavier! Please configurate a show instance. I will work with together gezza to fix this.
Thanks!
Laci

Hi! I fixed this bug, please check the commit rev 60132.

Jonny Bradley 03 Nov 16 14:56 GMT-0000

Hi molnarl,

I think the namespace separator is a preference so might be different. See `lib/setup.javascript.php` for how to expose a pref to javascript (yes i know, that file needs a proper tidy up! 😊)

Thanks!

Jonny Bradley 03 Nov 16 14:58 GMT-0000

P.S. you can use this handy plugin alias for revisions here - like this: `{commit id=60132} = r60132`

molnarl 06 Nov 16 17:42 GMT-0000

I think this bug is independent from namespace separator. So, what do you think, my solution should be better or is it correct?

Ok. I'm going to use this alias in the future.

Thanks!

I think... Thanks, so it will still work if the `namespace_separator` is set to something like "~"? (sorry, the code looked like it was splitting at colon chars, i didn't test it... 😊)

molnarl>Jonny Bradley 10 Nov 16 17:56 GMT-0000

Replied to Thanks, so...

Yes, it will still work, if you set other namespace separator. I have tested.

Because the problem is caused by the object selector:

e.g: `<option value="wiki page:TEST:_.Page">TEST:_.Page</option>`

The js function get this value. Firstly split at ':' character, and you get an array.

The first element is the type, but the other elements contains the page name. If the page's name don't contains ':' you get the full name in the second element of array. (id = `val.split(':')[1]`;))

Otherwise you get more than 2 elements, so you have to concatenate to get the full name.

Replied to

Yes, it... thanks for checking 😊
