Related-to

- ● alarm field type in trackers
- ✖ Add Conditional Actions for Tracker Fields

Description

We often need a way to do conditional things in tracker forms, like show or hide fields depending on the user's input, or require validation on some fields depending on the state of others.

So this is to start a discussion about how this should be implemented, should it be a new field type? Or a function of the tracker plugin (which needs significant tidying up) or what?

So they should look something like:

- Category field
 - If Category contains "bug" then
 - Show Workaround and Solution fields
 - Make Importance and Easy To Solve required

Solution

Done and added to Tiki 21.x

Easy to solve?

Your examples look like a "basic" script. Are you thinking we could integrate a basic-type tiki programming language? That would be awesome and useful not just in trackers!

My understanding of manipulating forms is that JavaScript is the goto language.

Since you can work with JavaScript in Tiki, probably anything needing manipulated could already be done through Tiki using available tags, plugins, and such.

But I'm hoping you are thinking of making it easier for end users and webmasters to implement.

Again, that would be awesome, useful, likely increase our user base and be a worthwhile investment of effort!
