Description

Java currently does not work on any major browser. (FF52, Chrome45, Edge/Win10)

Java has never worked on mobile.

I think safari is the only exception to this rule. IF there is a valid security certificate it will run if you jump several option deep in your security settings (no indication by the browser that this needs to be done) So its essentially completely user un-friendly, and will not under any circumstances run jCapture.

jCapture and Plugin Jabber are the only 2 parts of tiki that use java.

Jabber is completely broken. It points to a .jar file that is no longer in tiki.
jCapture wont run on any modern browser.

I vote for the removal of these 2 features from tiki 17

Solution

jCapture was removed in tiki17
