How about an infobox that will appear in the right column connected not only to wiki pages but to tabs within the wikipage. The info box would be able to be edited separately from the wiki page but be connected to the wiki page. The info box should be able to include video, maps, graphs,.

Here is an example of an infobox that I am working on but this one is not in the right column but within the page itself.

Nice idea, but I wonder if we don’t have already ways to do this in Tiki... (dynamic variable in a module ?)
