Description

After upgrade from Tiki12, testing:
<https://site.domain.com/shows>

Error No name indicated for wiki page

I was expecting HomePage

The same upgrade from Tiki12 to Tiki15 does not have this issue.

I can access the normal HomePage through <https://site.domain.com/tiki-index.php?page=HomePage>

I look up in <https://site.domain.com/tiki-admin.php?page=wiki> and I do see
Wiki homepage: HomePage

As confirmed in CLI:
web# php console.php preferences:get wikiHomePage
Preference wikiHomePage has value HomePage

Note: option *Group Homepages* is active and Anonymous does not have one. In Tiki 15 and before, it would logically default to the *wikiHomePage* value, i.e. HomePage
