Description

The WYSIWYG plugin no longer works starting from Tiki 17 if there is no page URL parameter, for example on the homepage.

I wrote in the wiki page the usual way to have the plugin to show up:

```
{WYSIWYG( )}  
{WYSIWYG}
```

I save the wiki page.

When one clicks the "Edit" button at the bottom right corner of the plugin, a JavaScript error occurs:

“

```
Uncaught TypeError: Cannot read property 'type' of null
at HTMLButtonElement. (tiki-ckeditor.js:188)
at HTMLButtonElement.dispatch (jquery.js:5206)
at HTMLButtonElement.elemData.handle (jquery.js:5014)
```

jqueryTiki.current\_object is null.

If the homepage is accessed using relative URL tiki-index.php, the issue occurs.

If the homepage is accessed using relative URL tiki-index.php?page=HomePage, the issue does not occur.

Tiki 16 does not have this issue.

## Comments

**Jonny Bradley** 03 Jul 17 09:47 GMT-0000

Any js console errors?

Seems to work fine for me here... (on Mac Chrome latest)

p.s. I usually just add just `{wysiwyg}` to get these started ;)
