Related-to
    • 🟠 H5P Content Creation Bug

Description
    When an H5P project is inserted into a wiki page, the browser url takes on the name of the H5P
    project application. Specifically with SEF url enabled.

   For example, if I create an H5P project, then I insert it into a wiki page by

    ⧉

    {h5p fileId="1373"}

    The browser tab no longer shows the wiki page name such as Wiki|Fubar Page
    Instead the browser tab will display Wiki|h5p_file_name

    Here is a screen capture of my user case, I created an H5P project for collages. I name my new H5P
    project home_page_collage and saved it to the file gallery.

    Using the syntax above, I inserted the collage into my wiki home page to display a group of images.
    Once the H5P project was inserted and saved into my home page wiki, the browser tab started
    displaying the H5P project file name, instead of Wiki|HomePage. See screen capture of error in
    browser tab.

Solution

    r63315 i hope?

Show instance is created, please see home page of show demonstrating bug.

Jonny Bradley 22 Jul 17 12:39 GMT-0000

Thanks John, i have seen that on my local Tiki, most odd - and not intentional, will have a dig about ;)

John Morris 23 Jul 17 00:38 GMT-0000

Jonny, I svn'd trunk, it was a mistake, so now I have Tiki18 in my live instance, but, the issue has been fixed it seems, do you also apply these fixes in the current trunk too?

Jonny Bradley 23 Jul 17 13:01 GMT-0000

Hi John,

Yes, all the fixes in 17.x are merged into trunk (by magic) so that everything that's fixed in 17 is still fixed in later versions.

I don't really follow how you would have switched from branches/17.x to trunk by accident when just doing an `svn up` but you can probably switch back to 17.x ok if you do it soon (having taken serious backups of everything, of course!)

p.s. You can use `php doc/devtools/svnup.php` if you like which does the svn update, clears caches, rebuilds the search index and various other useful think if you like. Use `php doc/devtools/svnup.php help svnup` to all the options first.

John Morris 23 Jul 17 00:40 GMT-0000

I SVN the show instance and it seems resolved as well, thanks Jonny!!!!!

Jonny Bradley 23 Jul 17 13:02 GMT-0000

Thanks, please close the ticket if we're all done with this one ~~(although one day i'd like to work out a better solution, like switching back to the wiki editor, as i said) wrong bug ;)~~

John Morris 25 Jul 17 01:50 GMT-0000

Well, I did this:

```
    svn checkout https://svn.code.sf.net/p/tikiwiki/code/trunk
```

Like a dummy, and I ended up with 18.
I did have it all backed up so I was able to reload it all up and just svn current 17, all is well now.
And thanks for the other svn tips, appreciate it much!

John Morris 25 Jul 17 01:50 GMT-0000

By the way, thanks so much for addressing this Jonny, you are most awesome.
