### Description

Semantic links are creating dead links when a "-" is in the name and under some other unknown conditions. I suspect it may in part be a regression caused by the recent way links are named.

You can see one example here: <https://dev.tiki.org/Visual-Programming>

At the bottom of the page, the aliases are listed. One of them is "End-user Programming" which creates a link of <https://dev.tiki.org/End-user-Programming>. The issue is, that does not redirect to the Visual Programming page. It is a 404-not found page. There are also 2 examples at the bottom of this page: <https://dev.tiki.org/Browser-Compatibility> that behave in the same way.

I also see alias is not working here as well: <https://dev.tiki.org/Update>. In this case, all of the alias links are dead, but there are no dashes used within the links. Perhaps a separate issue?
