Description
Since r24627, the IMG plugin supports percentages in its width or height parameter to scale the image. For example...
{img fileId="2970" width="50%"}
... would display image 2970 with its original dimensions halved.

This was unfortunately broken for Tiki 9 and later on some systems by r37006. Setting dimensions this way is ignored, for example on French systems, which use a comma as decimal separator instead of a point.

The attached patch fixes in 2 ways. Any one is sufficient. The change to tiki-download_file.php is not quite clean as it alters $_GET.

Note that this exposes a lack of validation in tiki-download_file.php.
