

Recently, someone added support for Tiki markup to the [Pandoc](#) due to the need to migrate one's content from the Tiki, so we can say there is kind of 'way out' for those wanting to change from Tiki to something else, at least, for blog posts, articles etc.

However, there is none support to convert to Tiki, although there is an open [issue](#) in regard.

So, my proposal it to take this issue more seriously (there is similar [issue](#) to make Tiki more friendly citizen for those wanting to move to/away from it.

Lastly, I'm also thinking that by having good support for Pandoc, I'd certainly take advantage to write some longer articles/posts using my preferred editor which provides helpers for the markup (e.g. rst), syntax highlighting etc., all while being offline and then just convert to Tiki Wiki markup.

It's a pity that Tiki does provide so many things, inherently missing in static-site-generators which have to be plugged via some 3rd party apps/services out, out of the box, but it lacks in import-export features.

There was also [wikiLingo](#) initiative, but it seems that it is stalled and/or [Robert](#) is no longer around?
