### Description

**EDIT: Could not Reproduce in Show! I try to fix with an upgrade. Reducing the importance of this bug report for now.**

#### Setup:

- Wiki Structure: on
  - Namespaces: on
    - separator: ~
    - tested also with: :
  - Hide namespace indicator in structure path: ticked (on)
  - Hide namespace indicator in page title: ticked (on)
  - Force all non-namespace page links to the same namespace: both settings (on/off)
- 
- Create a wiki page with a namespace name example:  
example~startstructure
  - Make a Structure from it
  - Create a new page mywikipage into the structure  
page gets correctly named example~mywikipage

#### Problem:

When in default settings the *Wiki URL scheme* is *URL encode (Tiki classic)* in `/tiki-admin.php?page=wiki`.

Then the Namespace rewrite does not work and the links / urls are `example+startstructure` instead of `example~startstructure`, why Tiki does not find the page and either gives an error message or a create page notice or a redirect to the HomePage, depending on further configurations.

Workaround:

When the *Wiki URL scheme* is set to *Replace Spaces with dashes* in `/tiki-admin.php?page=wiki`, the links / urls are still wrongly rewritten , but with dash instead of plus: `example-startstructure` and they do correctly redirect to `example~startstructure` .

Additional remarks:

I think, that the rewrite of the structures feature (wiki structure breadcrumb menu AND plugin toc) from the seperator to the dash (or otherwise the plus) is still wrong.

When I create a page `example-mywikipage`, then I can access the original page with following URLs / Links:

- `example~mywikipage?structure=example~startstructure`
- `example~mywikipage`
- `example-mywikipage?structure=example~startstructure`
- `example-mywikipage-2`

Where `example-mywikipage-2` is somehow defined as alternative URL from Tiki (18.x) without creating that page at all.

Only `example-mywikipage` directs to the new page!

`example-mywikipage?structure=example~startstructure` directs to the old page!

The wiki structure feature uses `example-mywikipage?structure=example~startstructure` as URL for `example~mywikipage` respectively instead of `example~mywikipage?structure=example~startstructure`

I'll try to reproduce with a show instance.
