In-page link targets on pages with sticky top navbar create no-click zones above the targets

I just came across a problem with the vertical offset for targeting headings with autotoc. That is, a problem caused by this code:

```markdown
{CODE()}

h1:target
before, h2:target
before, h3:target
before, h4:target
before, h5:target
before, h6:target
before {
```
which is inline CSS when autotoc and the sticky top navbar (in this case 83px in height) are used. In a page with some links just above a heading, the links can't be clicked because the transparent 83px-high target overlaps them from the heading below.

I tried a few tweaks to the CSS but didn't have any success. Probably at least it should be documented, that every heading or other in-page anchor targeted by a link will have a zone above it equal to the navbar offset set in L&F admin that shouldn't contain links or other HTML that needs to be clicked, etc.
