Description

I propose that a Tracker field type UUID is introduced. This field would - similar to the autoincrement field - create a universally unique identifier (UUID)

https://en.wikipedia.org/wiki/Universally_unique_identifier for every item while it is created or imported and will not change after creation.

With this field it will be easier to connect Tiki Trackers to other systems to exchange data (e.g. be able to push changed data sets from external databases). UUIDs are also common in systems that use calendars and contacts (CalDAV, CardDAV) to be able to identify data sets and avoid data duplication.

php: <https://www.php.net/manual/en/function.uniqid.php>

Nice idea @**nochnname**, how about adding it as an option on the existing auto-increment field type? I know then it would be called the "wrong thing" technically, but keeps things tidy imho 🍷
