Description

With version 21 the wiki pages which are part of a structure seem to be displayed as if the CSS isn't working. It looks like a very simple html page. At first I thought the bandwidth is so low so that the page is presented with the minimum information.

Please demonstrate your bug on show2.tikiwiki.org (select version 21.x and wait few minutes till the installation completes, then use show and password show if dialog appears and login as admin with admin pass to the Tiki instance and change the password to 12345).

Thanks!

David Bensel 11 Jun 20 07:43 GMT-0000

I'd love to. I started the creation process which lasted too long (surely more than 10 min) and then reloaded the page. Now the option is not there anymore - only to create a 18.x instance.

Jonny Bradley 11 Jun 20 10:29 GMT-0000

Ik, looks like show2 has fallen over again... hopefully someone will kick it soon 😊

David Bensel 12 Jun 20 18:50 GMT-0000

Is there anything I can do about it? The 'demonstrate bug' feature is still not there

Xavier de Pedro 12 Jun 20 23:04 GMT-0000

It seems the show2.t.o is created for you (after looking at the show2.t.o server), but as user-11990 instead of as your username which seems to be david@ndu
Maybe the issue is with usernames with the character @ in it? (and maybe with underscores and dots similar issue might be happening..., just an educated guess... maybe we should look at how those instances are created and improve the code somehow so that tiki is also able to fetch those instances which are apparently created even if linked to a different username at the server?) By "we" I mean @jonnyb / Jonny Bradley Jean-Marc Libs and Xavi (as xavidp - admin)

David, in the mean time, if you need to create show2.t.o instances, I guess you could register with a username without special characters (@ _ . at least). Or wait for a few days to see if we are able to find a solution during this weekends virtual tiki fest:

<https://tiki.org/TikiFestVirtual2020>

Jonny Bradley 13 Jun 20 18:37 GMT-0000

Hi David

We fixed it at the TikiFest today, mainly it was Jean-Marc Libs but it took the three of us to work it out!

So please see if you can recreate is on the new show instance, thanks!

David Bense > Jonny Bradley 16 Jun 20 08:12 GMT-0000

Replied to Hi David We...

Dear Jonny,

Thank you, it's working now. The instance <http://user-11990-7387.show2.tikiwiki.org> was already there, just like Xavier said.

Sometimes a 'gateway timeout' appears, but with reloading the page it's gone.

David Bense 16 Jun 20 14:12 GMT-0000

I tried to reproduce it, but I failed. What I found:

```
class uol (unordered list)
```

```
<body class="tiki tiki-index tiki_wiki_page fixed_width layout_basic en uol">
```

The class uol gets loaded with option 'Multilevel style numbering for ordered lists' enabled.

With my faulty page, there are no other styles loaded apart from uol.

When I disable 'Theme Control' it's okay. So I suspect it's a problem with my files / some css I tried to apply.

Jonny Bradley 16 Jun 20 14:27 GMT-0000

Looks like that comes from a curious preference called

wiki_make_ordered_list_items_display_unique_numbers which you can turn off in the textarea control panel, maybe it's broken?

David Bense 16 Jun 20 14:31 GMT-0000

Sorry, I modified my original post twice in the meantime.... (you've been too fast for me).

I think the problem is not with the particular version of wiki. It something I broke with my installation.

Jonny Bradley 16 Jun 20 15:48 GMT-0000

So is there actually a bug? If so can you update the description above and recreate it on the

show instance, theme control is always tricky to fix (i would avoid using it if possible ;)

luciash d' being 17 Jun 20 09:19 GMT-0000

That "curious preference" was added by me some time ago, but that is just applying some CSS to make the ordered lists display the numbers like "1.1.2" instead of "1." so that should not affect anything like that.
