Description

The admin UI for the schedular contains some help text that is strangely totally untranslateable.

/templates/tiki-admin_schedulers.tpl contains this at line 147:

{remarksbox type="note" title="{tr}Information{/tr}"} {tr}Use CRON format to enter the values in "Run Time":
 Minute, Hour, Day of Month, Month, Day of Week
 Eg. every 5 minutes: */5 * * * *{/tr} {/remarksbox}

Since the text is correctly enclosed in tr in curly braces. I am at a loss why this is the case, and why it throws no error?

Also, I seem unable to translate the task descriptions. These are ConsoleCommand, ShellCommand, HTTPGetCommand. I cannot even find the location where they are set. While I figure that admins who want to use schedulers might understand those terms, so task descriptors are slightly less important, but the help text about CRON syntax isn't.

Maybe the line breaks disturb tr/tra ? Or the hard line breaks in the text? Or the tabs (!)?

hman 23 Jul 20 16:19 GMT-0000

Found the solution. But it's stuff you can become crazy when figuring out. Remember, you have to view the settings of scheduler (which is two clicks), look what's rendered wrong, make corrections to custom.php, ftp upload custom.php, then go back to general settings, open cache management (or paste the URL), empty cache, go back to general settings, view scheduler settings and check to outcome of your changes, and you have to do this for each and every turnaround anew... (So that makes hell of a turnaround time 😕)

The solution is this string, that each and every translation needs in custom.php:

"Use CRON format to enter the values in \"Run Time\":\n\t\t\t\t\t
\n\t\t\t\tMinute, Hour, Day of Month, Month, Day of Week\n\t\t\t\t\t
\n\t\t\t\tEg. every 5 minutes: */5 * * * *" => "CRON-Format verwenden für neue Ausführungszeiten:
Minute, Stunde, Tag des Monats, Monat, Wochentag
z.B. alle 5 Minuten: */5 * * * *",

(I was right, hard line breaks and tabs are to blame. But as nonprinting characters you don't easily see them. To diagnose, you either have to copy & paste the string into a hex editor, or delete one character

at a time and watch what's happening. With newlines and tabs the difficult part is that for the visible result the order of them is irrelevant, but NOT for tra() pattern matchin 🙁

Devs, please DON'T use hard line breaks and tabs in strings by inserting raw ASCII. It is okay in code to get a structured listing, but NOT in strings (and by the way, you do not even know how they are visualized on the user's browser, as height and/or width might be restricted).
