Description
In tiki_categories-admin.tpl, the javascript function toggle is used to toggle tree nodes for subcategories. However, that function appears in two places - PHPLayers menu and tiki-js. Ouch.

This worked in 1.9 and is broken in 1.10

Same is true for the debug console and (I suspect) anything else that uses the toggle function.

I isolated the problem - I added the browse categories module - that includes phplayers-tiki.php, which includes lib/phplayers, which has the toggle function...

More tracking found the problem - it is in lib/phplayers/lib/treemenu.inc.php

the makeNewTree function looks for a menu_name variable that is added to the toggle function name. This works for the standard category view. However, somewhere along the line the name isn't passed properly in categories module.
The other complication is that the normal category browsing page doesn't work right with this module.

Oddly, phplayers is not included in the 1.10 head download, so I don't get it.

Solution
Please retest in latest 1.10 (HEAD)

I retested. PHPLayers appears to work now. However, toggletree still gives an error on the debug console.

mrisch 07 Jun 08 12:58 GMT-0000
OK, this is fixed. What was broken was the toggle in the admin menu. The debug console code in tiki-top_bar.tpl works just fine.
