Related-to
- ● Malformed date syntax in tiki-calendar_nav.tpl
- ● Calendar crashes in Year mode

Description
The template displays arrows to navigate to the previous and to the next period the calendar shall display, but the template pumps the raw internal values into the tooltips, and even that without translation, breaking the GUI, because "Previous" and "Next" get translated into the target language, but not the period label (e.g. "week") so giving the user a mixture of target language and English that is actual raw Tiki code.

{*previous*} <div class="cal-prev" style="display:inline-block; padding-right: 6px; position: relative; bottom: 20px; right: 100px"> {icon name="previous"} </div>

and

{*next*} <div class="cal-next" style="display:inline-block; padding-left: 6px; position: relative; bottom: 20px; left: 100px"> {icon name="next"} </div>

hman 10 Sep 20 14:20 GMT-0000

Created a workaround. I copied the functional labelling from the smaller module view to main view, and voilá, now the entire labels get translated. But this has a sideeffect: ALL languages translations' now have to add translations for all permutations of previous and next, day, week, month, quarter, semester and year (=12 new lines). But at least now it has become possible to translate it, previously it was impossible. See attachment. Btw., should you want to consolidate this into the code and split previous/next and day/week/month/quarter/semester/year into separate strings: At least in German (de.de) that is not a good idea, as the German translations of these period names have different gender, therefore "next" and "previous" (Nächste/Vorherige) have different conjugations, so please don't split that up. Other languages might have similar implications...

hman 10 Sep 20 15:02 GMT-0000

Wrote a another workaround to fix the malformed date syntax that forced slashes as separators between day or month and year upon all languages, regardless of translation (because it both ignored the existing user pref about date syntax AND possible translations, because the %Y was written outside

tra/tr.

This workaround also has a side effect for all language's translations. Although I cannot speedily write a code that uses the user pref, I could move the %Y into the tra/tr, but that means that writers of translations must translate these strings (both orders of day and month, because correct usage of the pref is unclear):

```
"%d/%m" => "%d.%m.", "%m/%d" => "%d.%m.", "%m/%d/%Y" => "%d.%m.%Y", "%m/%d/%y" =>
"%d.%m.%y", "%d/%m/%Y" => "%d.%m.%Y", "%d/%m/%y" => "%d.%m.%y",
```

Also, somewhere might be a %y instead of %Y, so just to be sure...

(this is the translation for German de.de, which is why I have to update the custom.php I uploaded on the "Please update German translation" bug report...)

hman 04 Feb 21 16:58 GMT-0000

Still broken in 18.8.

hman 12 Feb 21 09:39 GMT-0000

Broken up to 22.1.

Matthias Brenner 02 Jun 21 07:50 GMT-0000

I installed a fresh new instance of tiki. From the start calendar navigation works fine. At the moment I created only one calendar item, the navigation is broken. When I delete the calendar item the navigation again works as requested.
Thus only one calendar entry breaks navigation through the calendar. Therefore calendars are not really usable at the moment.

Jonny Bradley 02 Jun 21 08:09 GMT-0000

The show instance here wasn't set up much, so i reset the admin password (to 12345) and added a calendar which seems to work as expected i think, i added one item here http://hman-11504-7523.show2.tikiwiki.org/tiki-calendar.php

What's up with yours?

hman 02 Jun 21 08:39 GMT-0000

Hm, I don't think this works as expected. I do not see tooltips at all ?! And btw, why is the "today" button greyed out?

hman 02 Jun 21 08:44 GMT-0000

And when you click on "year" Calendar crashes altogether. But I have opened another bug ticket for that (one of MANY). See attachment.

hman 02 Jun 21 08:49 GMT-0000

What you see in the seemingly garbled up pixels is raw unformatted ASCII text in VERY small font size. Also, this error is thrown:
ERROR (E_WARNING): A non-numeric value encountered
At line 282 in tiki-calendar.php

Thu Fri Sat Sun Mon Tue Wed Thu Fri Sat Sun Mon Tue Wed ... and this goes on and on... until dates appear... 12/31 1/1 1/2 1/3 ...and on and on... ...until a full year got dumped to the screen in ASCII!

Jonny Bradley 02 Jun 21 10:34 GMT-0000

Weird, can you try in a different browser please?
It looks as expected to me in Safari, Chrome/Brave and Firefox...

hman>Jonny Bradley 02 Jun 21 15:28 GMT-0000

Replied to
Weird,...

I did test with Firefox on Linux...
Cross-check with IE 11 on Windows: Calendar view dysfunctional altogether, only list view working.
Edge: No tooltips, 'today' greyed out, crash in year mode. Exactly the same as with FF (not suprising given the fact that Edge runs the Chrome engine).

hman>hman 02 Jun 21 15:43 GMT-0000

Replied to
I did... Another cross-check with Opera on Linux: Just the same: No tooltips, 'today' greyed out, crash in year mode...

Matthias Brenner 02 Jun 21 14:05 GMT-0000

I attached a new video to show my problem.
I used Firefox (always up to date) and Tiki 22.1 with MySQL.

Jonny Bradley 02 Jun 21 14:56 GMT-0000

Thanks, that looks quite broken, there is an issue with single all-day events spanning more than one day - but it looks like your javascript is broken (try clearing caches?), can you try it on the show instance and see what happens?

Matthias Brenner 06 Jun 21 18:55 GMT-0000

Logged in with user/password (show/show): "You do not have permission to view the calendar"

In my test installation, I tried also a single event lasting one hour, same result, navigation is broken (Firefox).

I could give you access to my test installation. My productive installation is used by many people who all encounter the problem. So I thought it should not be a problem with the browser.

I tried to enter events with Chrome:
- Click on the date and create an event
- Click on "add event" to insert a new event
Both worked fine. But all event lasting several days kills the navigation (I used the toggle "all day").

Since we manage a little hut in Italy, the calendar events represent the occupation of the hut. Therefore all our events last more than one day.

So there is a difference between the two browsers (Chrome and Firefox).

Another problem is, that my Firefox installation does not show the title of the events.

I remember, that I created a calendar named "sample". Can I use calendars without creating a calendar instance?

At the moment I've no further ideas what could be helpful to locate the problem.

Kind regards
Matthias

hman 07 Jun 21 07:44 GMT-0000

On show.tiki.org you normally have to log in as admin (usually 12345). The credentials show/show are for the access to the virtual machine only...

Matthias Brenner 07 Jun 21 16:11 GMT-0000

I tried it. Navigation worked fine.

The "all day" calendar event was not displayed even if I set the appropriate option.
"All day" was not the default, even if I selected it within the options.

What is now the difference? I used the same browser as on my instance. My instance shows the event name for all days of the event, but breaks the navigation. This is true for the test installation which I created from scratch.
